DAY 1 CHALLENGE

Task

To complete this challenge, you must save a line of input from stdin to a variable, print `Hello, World.` on a single line, and finally print the value of your variable on a second line.

You've got this!

Note: The instructions are Java-based, but we support submissions in many popular languages. You can switch languages using the drop-down menu above your editor, and the $inputString$ variable may be written differently depending on the best-practice conventions of your submission language.

Input Format

A single line of text denoting $inputString$ (the variable whose contents must be printed).

Output Format

Print `Hello, World.` on the first line, and the contents of $inputString$ on the second line.

Sample Input

```
Welcome to 30 Days of Code!
```

Sample Output

```
Hello, World.
Welcome to 30 Days of Code!
```

CODE:

```python
# Read a full line of input from stdin and save it to our dynamically typed
variable, input_string.
input_string = input()

# Print a string literal saying "Hello, World." to stdout.
print('Hello, World.')
print(input_string)

# TODO: Write a line of code here that prints the contents of input_string
to stdout.
```
